AI Legal Access Assistant

Bridging the Justice Gap with Intelligent Legal Guidance

Made with GAMMA

The Justice Gap Crisis

Millions of Americans face legal issues every year without access to affordable counsel. The justice system remains complex, intimidating, and financially out of reach for everyday citizens dealing with landlord disputes, consumer complaints, or cyber fraud. This gap creates real hardship—people lose deposits, fall victim to scams, and suffer without recourse.

Our AI Legal Access Assistant democratizes legal knowledge by providing instant, clear guidance to three critical legal domains where citizens most frequently encounter barriers. By combining intelligent natural language processing with structured legal frameworks, we empower users to understand their rights and take informed action without immediately requiring expensive legal representation.

This 30-hour MVP demonstrates how AI can serve as a first line of defense for legal issues, guiding users through their problems with step-by-step assistance while recognizing when professional legal counsel becomes essential. The system doesn't replace lawyers—it helps people decide when they need one and prepares them with the knowledge to engage effectively.

Made with GAMMA

Three High-Impact Legal Domains

Tenant-Landlord Disputes

Security deposits, lease violations, habitability issues, eviction notices

- Deposit return rights
- Repair obligations
- Lease termination procedures

Cyber Fraud & Online Scams

Phishing attacks, unauthorized transactions, identity theft, fake websites

- Immediate reporting steps
- Financial protection rights
- Documentation requirements

Consumer Complaints

Defective products, false advertising, warranty issues, merchant disputes

- Refund and replacement rights
- Federal trade protections
- Small claims procedures

These domains represent the most common legal issues facing everyday citizens—situations where immediate, clear guidance can prevent escalation and preserve rights. Each area has well-established legal frameworks that AI can reliably interpret and explain in plain language, making them ideal candidates for automated assistance.

Made with GAMMA

Smart Legal Guidance Engine

How It Works

Users describe their situation in natural language, either by typing or speaking. The system employs sophisticated intent classification to identify the legal domain and specific issue, then generates structured guidance that breaks down complex legal concepts into actionable steps.

Unlike generic chatbots that produce paragraph chaos, our engine delivers organized, scannable responses with clear sections: rights explanation, relevant laws simplified, step-by-step actions, required documentation, and estimated timelines. This structure ensures users can quickly find what they need without wading through verbose AI responses.

The guidance engine leverages prompt engineering rather than custom ML training, making it feasible to build within 30 hours while maintaining accuracy. By focusing on three specific legal domains with established precedents, we can create targeted prompts that reliably produce correct interpretations of state and federal regulations.

Sample Output Structure

Your Rights Explained

Landlords must return deposits within 30 days with itemized deductions

Relevant Law

State Tenant Protection Act § 551

Next Steps

1. Draft demand letter
2. Gather move-in documentation
3. File small claims if needed

Made with GAMMA

Legal Notice Generator: The Killer Feature

A well-crafted legal notice can resolve disputes before they escalate to court. Our generator transforms user-provided case details into professionally formatted, legally sound demand letters that citizens can immediately use to assert their rights. This feature alone demonstrates tremendous value to judges—it produces tangible, actionable output rather than just information.

01

User Input Collection

Simple form captures names, addresses, dispute details, monetary amounts, and relevant dates

02

Document Structuring

AI arranges information into proper legal format with appropriate headings and sections

03

Language Generation

Professional, assertive language drafted using legal templates and precedents

04

PDF Generation

Downloadable, printable document formatted for official correspondence

The generator handles the three target domains with specialized templates for each scenario. For tenant disputes, it creates deposit demand letters with citations to state landlord-tenant laws. For cyber fraud, it produces reporting letters to financial institutions and service providers. For consumer issues, it drafts warranty claims and merchant complaints. Each template includes placeholders for jurisdiction-specific requirements, ensuring compliance with local regulations.

Users can customize the generated notices with additional details before downloading, maintaining human oversight while benefiting from AI efficiency. The resulting PDFs look professionally drafted, giving citizens confidence when asserting their rights against landlords, merchants, or service providers.

Made with GAMMA

Severity & Urgency Intelligence

Real-Time Classification

AI analyzes case details to determine urgency level within milliseconds

Visual Indicators

Color-coded alerts guide user attention to time-sensitive situations

Action Prioritization

System recommends immediate vs. planned actions based on classification

Low Urgency

Standard documentation gathering, routine disputes, non-time-critical issues

Response: 3-7 days to act

Medium Urgency

Approaching deadlines, escalating disputes, documentation time limits

Response: 24-72 hours to act

High Urgency

Active fraud, immediate financial loss, legal holds expiring, 24-hour windows

Response: Immediate action required

This intelligence layer transforms the system from passive information provider to active crisis assistant. When a user reports "my credit card was just used fraudulently," the system immediately flags high urgency and prioritizes steps like card cancellation and fraud reporting over secondary actions. The urgency detection uses pattern matching and keyword analysis—techniques implementable through prompt engineering rather than complex ML training—making it feasible within our 30-hour timeline while delivering impressive demo impact.

Made with GAMMA

System Architecture & Technology Stack

Web Interface

React frontend with voice input capabilities

Backend API

Node.js server handling requests and routing

AI Engine

LLM with legal prompts and classifiers

PDF Generator

Dynamic document creation from templates

Implementation Strategy

The architecture follows a clean, linear flow that prioritizes reliability over complexity. User interactions pass through a Node.js backend that orchestrates the AI processing pipeline. The legal intent classifier—a carefully engineered LLM prompt—analyzes input text to identify domain and specific issue type, then routes to specialized response generators for each legal area.

Response generation uses domain-specific prompts that incorporate legal frameworks, precedents, and jurisdictional variations. The system maintains state through minimal database tables (Users, Cases, GeneratedDocuments), storing enough information to support follow-up interactions without over-engineering. PDF generation uses established libraries like PDFKit or Puppeteer, formatting structured AI output into professional documents with consistent styling.

Voice integration, while optional, provides tremendous demo impact. Speech-to-text transcription via Web Speech API or ElevenLabs, combined with text-to-speech output, creates an accessible, conversational experience that works for users who prefer speaking over typing. This layer adds polish without requiring fundamental architectural changes.

30-Hour Execution Roadmap

1

0-3 Hours: Foundation

Finalize feature scope, assign team roles, establish version control, scaffold backend API endpoints, and create basic frontend structure with routing

2

3-10 Hours: Core AI

Build intent detection classifier, implement legal guidance generation for all three domains, test with diverse scenarios, refine prompt engineering, establish response formatting standards

3

10-16 Hours: Document Generation

Design complaint form UI, implement PDF generation from structured data, ensure proper formatting and styling, test edge cases, validate document legality

4

16-22 Hours: Polish

Enhance UI with dark navy theme, add urgency indicators, implement loading states, build error handling, improve accessibility, conduct internal user testing

5

22-26 Hours: Voice

Integrate speech-to-text input, add text-to-speech output, create audio playback controls, test voice interactions, optimize for mobile devices

6

26-30 Hours: Finalize

Test edge cases and error conditions, prepare pitch deck with impact metrics, rehearse demo flow five times, document code, create deployment package

This timeline assumes a 3-4 person team working in parallel. Backend development can proceed independently from frontend work once API contracts are established. AI prompt engineering requires specialized attention during core development hours, while UI polish and voice integration can happen concurrently. The final hours prioritize demo readiness—practicing the pitch until it's flawless ensures judges see the system's full potential rather than getting stuck on technical glitches.

Made with GAMMA

UI Design & User Experience

Design Philosophy

The interface embraces a serious, professional aesthetic that inspires trust. Dark navy themes with electric blue accents create a courthouse-appropriate atmosphere while remaining accessible. Typography favors serif fonts for body text (conveying authority) paired with clean sans-serif for UI elements (ensuring readability). Color choices use electric blue for primary actions, navy for backgrounds, and purple for urgency indicators.

Key Interface Patterns

Structured Response Cards

Each guidance section appears in clearly delineated cards with consistent headers, making complex information scannable and organized

Progressive Disclosure

Detailed explanations expand on click, keeping initial view uncluttered while providing depth when users need it

Visual Urgency Indicators

Color-coded banners and icons immediately communicate time sensitivity without requiring users to read detailed text

Navigation follows clear linear flow: describe problem → receive guidance → generate documents → download or share. Loading states provide feedback during AI processing, preventing user anxiety during the few seconds required for LLM responses. Error messages guide users toward solutions rather than simply indicating problems. Mobile-responsive design ensures accessibility across devices, recognizing that many users without legal resources also lack desktop computers.

Made with GAMMA

Why This MVP Wins

Strong Social Impact

Addresses real justice gap affecting millions of low-income citizens who cannot afford attorneys for routine legal issues

Clear Usability

Intuitive interface with structured outputs ensures users can act on guidance without confusion or legal expertise

AI + Real Output

Generates downloadable legal notices as PDFs—tangible deliverables that demonstrate concrete value beyond conversation

Government Scalable

Architecture supports multi-jurisdiction expansion, integration with legal aid organizations, and public service deployment

Professional Positioning

Includes responsible AI disclaimers, recognizes limitations, guides users to professional counsel when appropriate

30-Hour Feasible

No custom ML training required—prompt engineering and existing APIs make full implementation achievable in hackathon timeframe

This MVP transforms how citizens access legal guidance, providing immediate, structured assistance for three critical domains where professional representation remains financially out of reach. The legal notice generator produces professional documents that users can immediately deploy in disputes, while urgency intelligence ensures time-sensitive situations receive appropriate attention. Voice capabilities make the system accessible to users who struggle with text-based interfaces. Dark navy theming and courthouse-appropriate aesthetics establish trust and professionalism.

The 30-hour execution plan demonstrates realistic scope management—focusing on three domains prevents feature creep while allowing polished implementation of core features. Prompt-based AI engineering rather than custom ML training keeps the build feasible. Judges see immediate impact during demo: describe a tenant dispute, receive rights explanation, generate demand letter, download PDF, and hear voice summary. This flow—from problem to solution in minutes—shows how AI can democratize legal access for everyday citizens facing real hardship.
